Approved Octane Rating: not less than 94 RON/ROZ

Approved fuel grades: preferably AVGAS 100LL

Fuel grades like Car Super, Euro-Super, and Super-plus are also permissible.
The US 94 octane rating complies with the minimum relative octane number required by the engine manufacturer.
For further data refer to the Engine Manual AESOR.

Engine oil: Preferably Sikkolene Comp 2 Pre-mix. However, Mobil Pegasus 485 or Castrol Aviation A545 or Spectro Oils of America "Golden Spectro" can also be used.

2.13 Minimum Equipment

Minimum Equipment consists of:
1 x ASI indicating up to 300 km/h = 162 kts
1 x Altimeter
1 x 4-part seat harness (symmetrical)
1 x Magnetic Compass
1 x ILEC engine control unit
1 x rear view mirror
1 x parachute or back cushion

For flights beyond the environs of the airfield at which the flight originates an aircraft radio is mandatory (for Germany). In addition, headphones should be worn when the engine is running.

Approved equipment is listed in the Maintenance Manual in Section 12.1.
2.14 Aerotow, winch- and autotow-launching

The maximum launch speeds are:

- for aerotow: 150 km/h (80 kts)
- for winch- and autotow-launch: 130 km/h (70 kts)

For all launching methods a weak link of 675 to 825 daN must be used in the launch cable or tow rope.

For aerotow, the tow rope must be not less than 40 m (135 feet) in length.
2.15 Operating Limitations Placard

This placard is fixed at the left cockpit side wall and contains the most important Mass and Speed Limitations.

Sopwith Bouguignon A. Schüchter GmbH & Co. Poppenhausen

**Max. Permissible Speeds:**

- Care A:
  - Winch Launch: 146.8 kts
  - Aeroway Alt: 103 kts
- Extending Landing Gear:
  - Max. Speed: 92.2 kts

**With Power/Plant Running:**

- With standard propeller: 99.2 kts
- With Ram-Air Propeller: 96.5-98.5 kts

**With Winch/Launch:**

- 675 kts (625 dN)

**Tire Pressure:**

- Main Wheel: 2.9 to 3.3 Bar (42 to 48 psi)
- Tail Wheel: 2.4 to 2.6 Bar (34 to 37 psi)

Reduced minimum cockpit load without trim ballast in the fin - see flight manual - Page 6.4

Reduced minimum cockpit load with power-plant dismantled - see flight manual - Page 6.4

Reduced minimum cockpit load without barograph in the engine compartment - see flight manual - Page 6.4

LBA - APP.
Reduced minimum cockpit load by fitting removable trim ballast in front of the pedal assembly: see Section 7.13.

The baggage compartment load must not exceed 15 kg – 33 lb.

Baggage compartment load  max. 15 kg  
(33 lbs.)
brake and shock absorber element. If badly soiled, the landing gear should be cleaned immediately. Also: do not forget to clean and lubricate the wheel bearings and shock absorber bearings.

Tires

Tire pressure should be checked frequently. When the tread is worn, the tire must be replaced. The tire must be protected from all kinds of grease and oil, as these will attack and damage the rubber.

Tire Sizes:

- Main Wheel: 5.00-5, 6pr TT
- Tire with inner tube 5.00-5 TR67A
- Tail Wheel: 210 x 65 tire with inner tube

Tire Pressures:

- Main Wheel: 2.9 to 3.2 bar (= 42 to 46.5 psi)
- Tail Wheel: 2.4 to 2.6 bar (= 34.8 to 37.7 psi)

Wheel Brake System

To maintain and adjust the hydraulic brake, the small fairing at the rear landing gear bulkhead must be removed. If the action of the wheel brake is found to be poor or altogether ineffective, this may be due to the following causes:

1. Brake linings may be worn and needing renewal.
2. Air may have entered the brake line and necessitate bleeding of the brake system.

3. No brake fluid in the system; check brake system for leaks, replenish brake fluid and bleed system.

NOTE: As the hydraulic wheel brake and the airbrakes are actuated by a common brake lever in the cockpit, it is necessary to ensure that both systems are accurately adjusted relative to each other.

The master cylinder also acts as the stop for the airbrake control linkage. By untightening the lock nut at the master cylinder and turning in or out the adjusting head (see Fig. 2.5-1), the hydraulic system may be adjusted so that it acts as the stop damper.

How to Adjust the Brake:

With the aircraft rigged, the wheel brake must begin to act already distinctly when the airbrake lever in the fuselage is in the position as shown in Fig. 2.5-2. When the lever is pulled back by further 30 mm using maximum hand force, the brake pressure should limit the travel of the brake lever. The airbrake in the wing must just not yet be at its stop.

NOTE: A possible uneven extending of the airbrakes is no problem and even intended as the airbrake control linkage has been adjusted this way in order to reduce the toggle lock force.
